M1963 Series– AC/DC Power Supply

Functions and Signals

INHIBIT (pin 4)

Description: The **INHIBIT** signal is used to turn the power supply ON and OFF.

Operation: Applying "1" or leaving open will turn the power supply ON.

Applying "0" or shorting this pin to its return line will turn the power supply OFF. For constant operation, leave this pin unconnected.

Signal Type: 5V TTL or dry contact (open/short).

Return line: This signal is referenced to **SIGNAL RTN** (pin 5).

SYNC (pin 17)

Description: The **SYNC** signal can be used to allow the power supply switching frequency to synchronize with a system clock.

Operation: Apply a square wave clock with frequency in the range of 450 kHz $\pm$ 10 kHz and duty-cycle of 50% $\pm$ 10%, TTL level.

If not required, leave open. The power supply will work at 450 kHz $\pm$ 10 kHz (internal clock).

Signal Type: 5V TTL

Return line: This signal is referenced to **SIGNAL RTN** (pin 5).

PWR GOOD (pin 18)

Description: The **PWR GOOD** signal indicates the status of the output voltage.

Operation: When the output voltages rise above 90% $\pm$ 5% of its nominal value, pin 18 will be pulled down to pin 6 through a 100 Ω $\pm$ 1% resistor and three phototransistors.

When one of the output voltages falls below 90% $\pm$ 5% of its nominal value, pin 18 will be in high impedance mode.

If not used, leave the signal unconnected.

This signal is the series connection of three opto-couplers and a 100 Ω resistor to limit the current.

Signal Type: Isolated open collector.

Return line: This signal is referenced to **PWR GOOD RTN** (pin 6) and is floating from all other pins.

WARNING: Mind the polarity! Connecting a reverse polarity voltage source with current limit higher than 30mA to this signal will result in permanent damage to the converter.

SIGNAL RTN (pin 5)

Description: Both **INHIBIT** and **SYNC** signals are referenced to this pin.

Typical Connection Diagram

Note: PWR GOOD- the load for the pull-up resistor and the auxiliary voltage shown in this diagram should be less than 1mA. The system designer must select the actual values such that no damage can occur to the internal components of the power supply – **consult factory for more information**
